Abstract

Weather data monitoring is ongoing since 2013 in a network of three sites located in the Campi Flegrei volcanic area, near Naples (Italy) in the framework of the MONICA (Innovative Monitoring of Coastal and Marine Environment) Project. The aim of this activity is to acquire time series to analyze the influence of meteorological factors on geomorphological coastal processes, such as cliff retreat, landslides and beach erosion. The uploaded dataset includes data (temperature, rain, wind, barometric pressure and humidity) acquired at the Capo Posillipo automatic weather station (model DAVIS Vantage Pro2 wireless) during the period Dec. 2013 - Oct. 2018. The station is located in the western sector of the urban area of Naples (Italy). Automatic data transfer from the weather station to the ISMAR-CNR processing center, located in the Naples harbor, is routinely performed via an Internet LAN connection.
