Executive Summary

In March 2007 CSU-Monterey Bay began hydrologic monitoring of Santa Lucia Preserve for the Santa Lucia Conservancy. This project is a continuation of monitoring begun by Balance Hydrologics as part of the permit requirements for land development. The purpose of this annual report is to present data summaries for the 2007 water year (October 1, 2006 to September 31, 2007). Rainfall in water year 2007 was very low, representing the 15 year drought rainfall. Streamflow was relatively low as well as indicated by baseflow conditions approaching the drought conditions of water-year 1991 (Croyle and Smith, 2007).

This report can be cited as:

1 Introduction

This report is a hydrologic data summary for Santa Lucia Preserve for Water Year 2007 (WY-07). Data summaries are presented for streamflow on Potrero and San Clemente Creeks and for precipitation on Santa Lucia Preserve and San Clemente Dam.

Balance Hydrologics has operated four continuously recording streamflow gages on Santa Lucia Preserve. These gages include two on Las Garzas Creek (Moore's Lake inflow and outflow, installed in 2001), one on Potrero Creek (installed in 2002), and one on San Clemente Creek (installed in 2002). Detailed information on gage installation, operation and individual gage sites is available in Balance Hydrologics (2002). WY-07 streamflow data for both gaging stations on Las Garzas Creek can be found in Balance Hydrologics (2007a). Operation of the Potrero Creek and San Clemente Creek streamflow gages was transferred to CSUMB Watershed Institute on June 21, 2007.

2 Precipitation Data

Precipitation data presented here is from a Rain Bird weather station operated by Santa Lucia Preserve. Precipitation data recorded by California American Water Company at nearby San Clemente Dam are also included for comparison.

WY-07 was an extremely dry year, ranking the eighth driest year since 1922 (based on the 86-year San Clemente Dam precipitation record). At San Clemente Dam the total WY-07 rainfall was 11.37 inches (Table 1 and Figure 1). The average rainfall at the Dam is 21.42 inches. Using Log-Pearson Type-III analysis, rainfall at San Clemente Dam should be 11.37 (or less) once every 15 years on average (Figure 2). Total recorded rainfall at Santa Lucia Preserve in WY-07 was 15.5 inches (Table 2 and Figure 3).

3 Streamflow, Temperature, and Conductance Data

The streamflow gaging stations on Potrero and San Clemente each consist of a Campbell CR10X data logger (powered by 10 or 20 watt solar panels), two Druck pressure transducers to measure water depth, Campbell specific conductance

and water temperature probe, as well as staff plates for manual readings (Balance Hydrologics 2002). Data loggers record measurements of pressure, temperature, and conductance at 15-minute intervals.

In WY-07, streamflow gage data was downloaded to a laptop computer during monthly visits, at which time manual discharge measurements were also taken using standard hydrologic practices. A Swoffer (model 3000) current velocity meter was used to measure discharge. A portable Parshall flume was used during the latter part of the dry season when flows became too low to use the Swoffer meter.

3.1 Potrero Creek

The current gage station on Potrero Creek was installed April 29, 2002 and is located upstream of the T-11 well. In WY-07, Potrero Creek had a mean daily flow of 0.19 cfs, a maximum daily flow of 5.15 cfs, and a minimum daily flow of <0.01 cfs; the 7-day low flow was also <0.01 cfs (Table 3). Mean daily streamflow and manual discharge measurements are plotted in Figure 4. Temperature and conductance data are presented in Tables 4 through 7, and in Figure 5.

3.2 San Clemente Creek

The current gage station on San Clemente Creek was installed April 30, 2002 and is located near the Santa Lucia Preserve property boundary. In WY-07, San Clemente Creek had a mean daily flow of 0.42 cfs, a maximum daily flow of 8.09 cfs, and a minimum daily flow of 0.03 cfs; the 7-day low flow was 0.04 cfs (Table 8). Mean daily streamflow and manual discharge measurements are plotted in Figure 6. Temperature and conductance data are presented in Tables 9 through 12, and in Figure 7.

4 Limitations

Streamflow gage data are based on the stage-discharge relationship unique to each stream and gage location. This stage-discharge relationship (rating curve) for each gage has been developed over time by making manual discharge measurements at various ranges of flow and noting the water level (stage) at which a particular flow occurs. As more discharge measurements are made (particularly in the higher range of flows) the rating curves may change and it will be necessary to update the streamflow data to reflect these changes. For

this reason, the streamflow data contained in this report should be considered provisional and caution should be exercised when using these data.

7 Figures

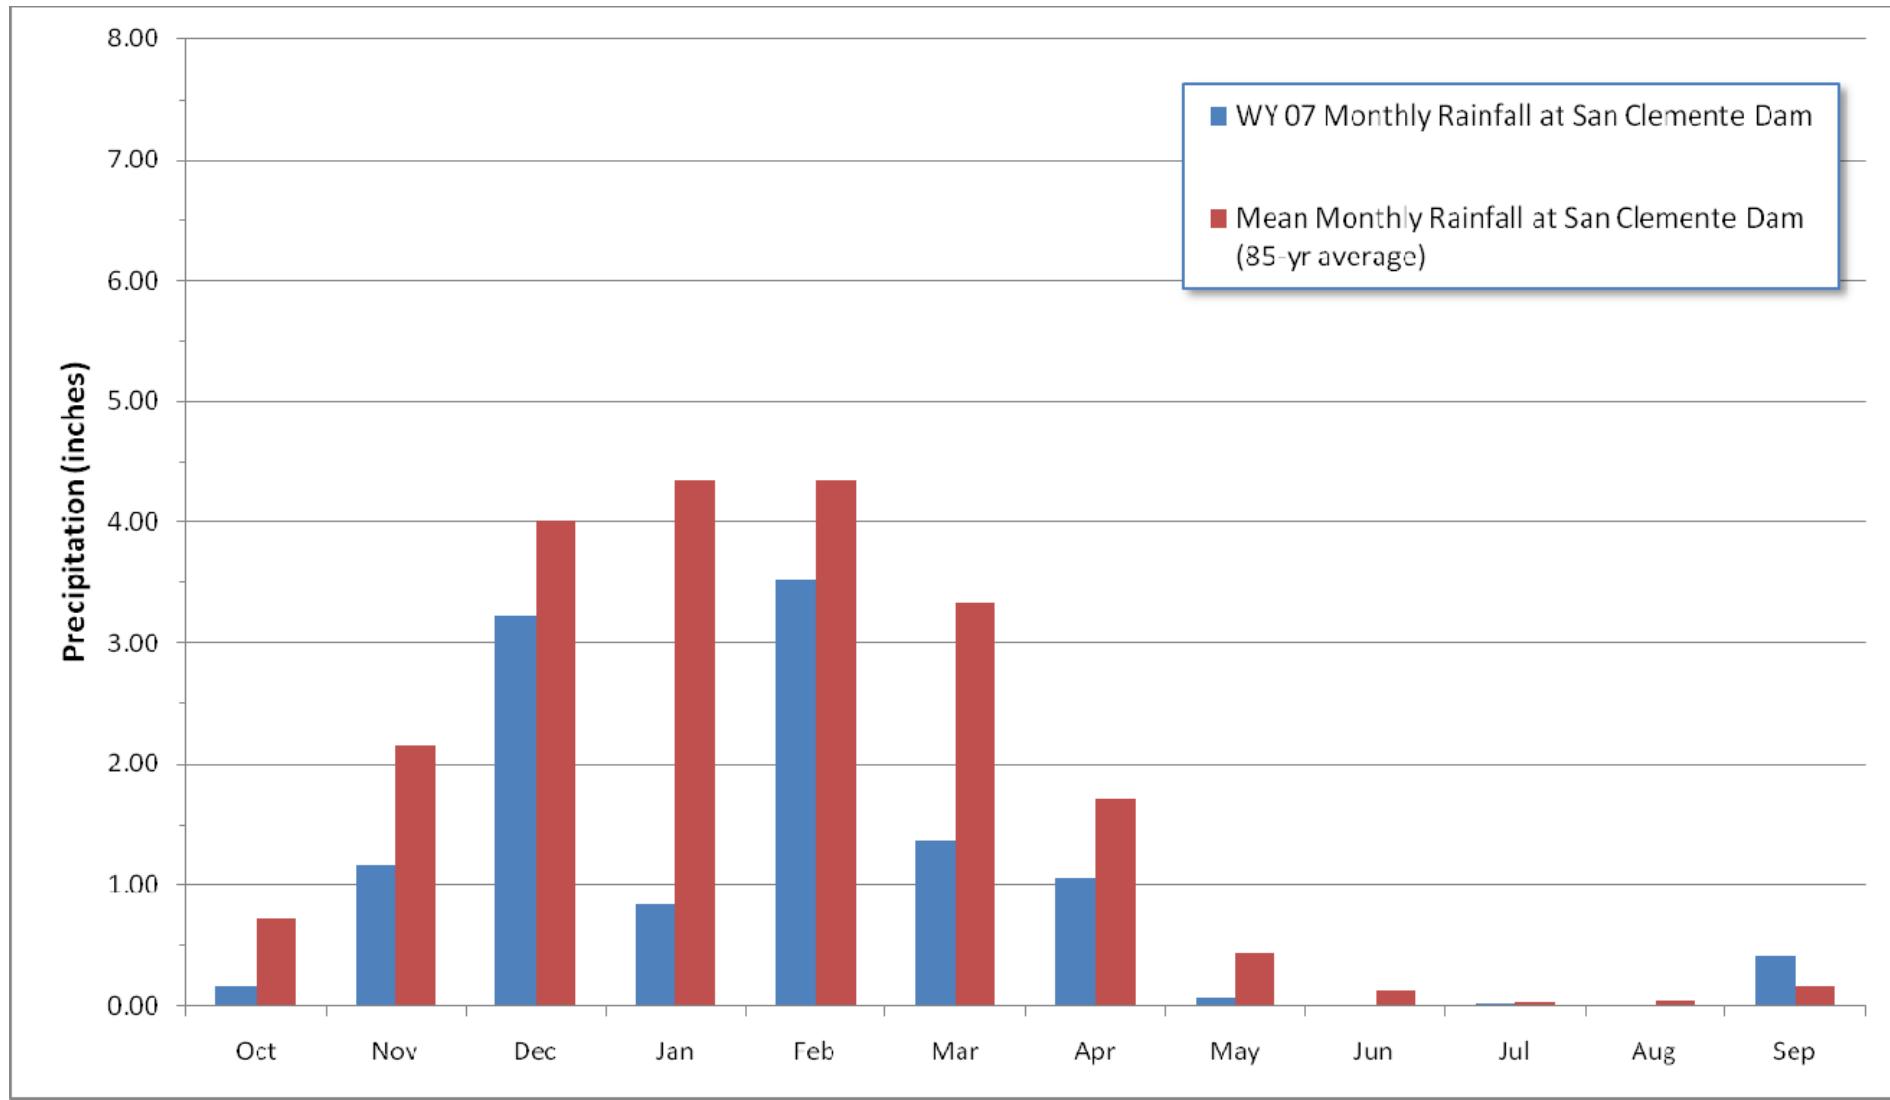

Figure 1. Monthly precipitation at San Clemente Dam for Water Year 2007. WY 2007 precipitation was well below average for all months except September; January was particularly dry. Mean monthly data is based on Water Years 1922 – 2006.

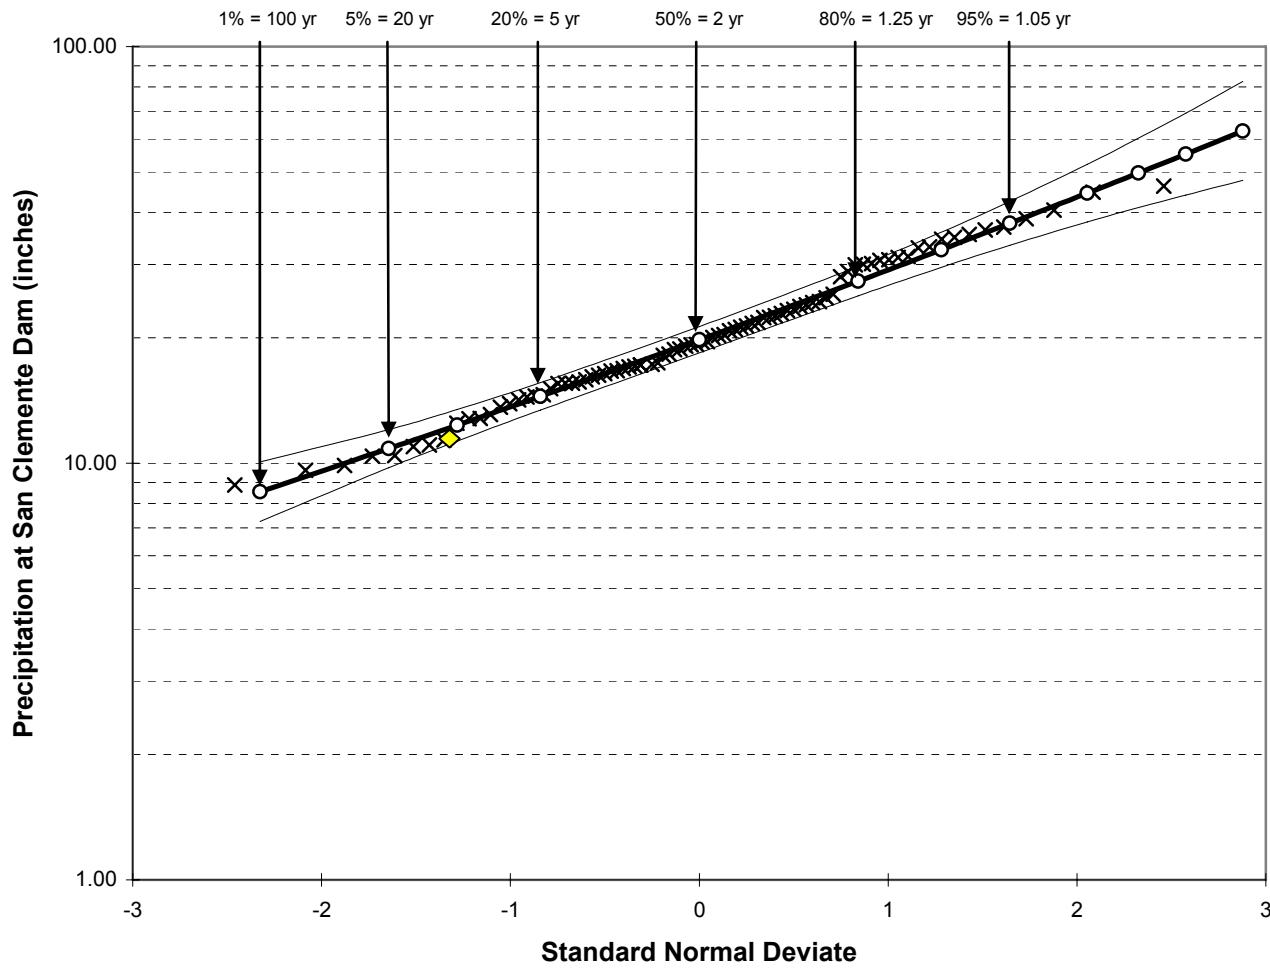

Figure 2. Log-Pearson Type-III statistical analysis of historic precipitation data from San Clemente Dam. Thin curved lines represent upper and lower 95% confidence bounds for precipitation and non-exceedance probability. Diamond symbol is the 2007 water year 11.37 inches.

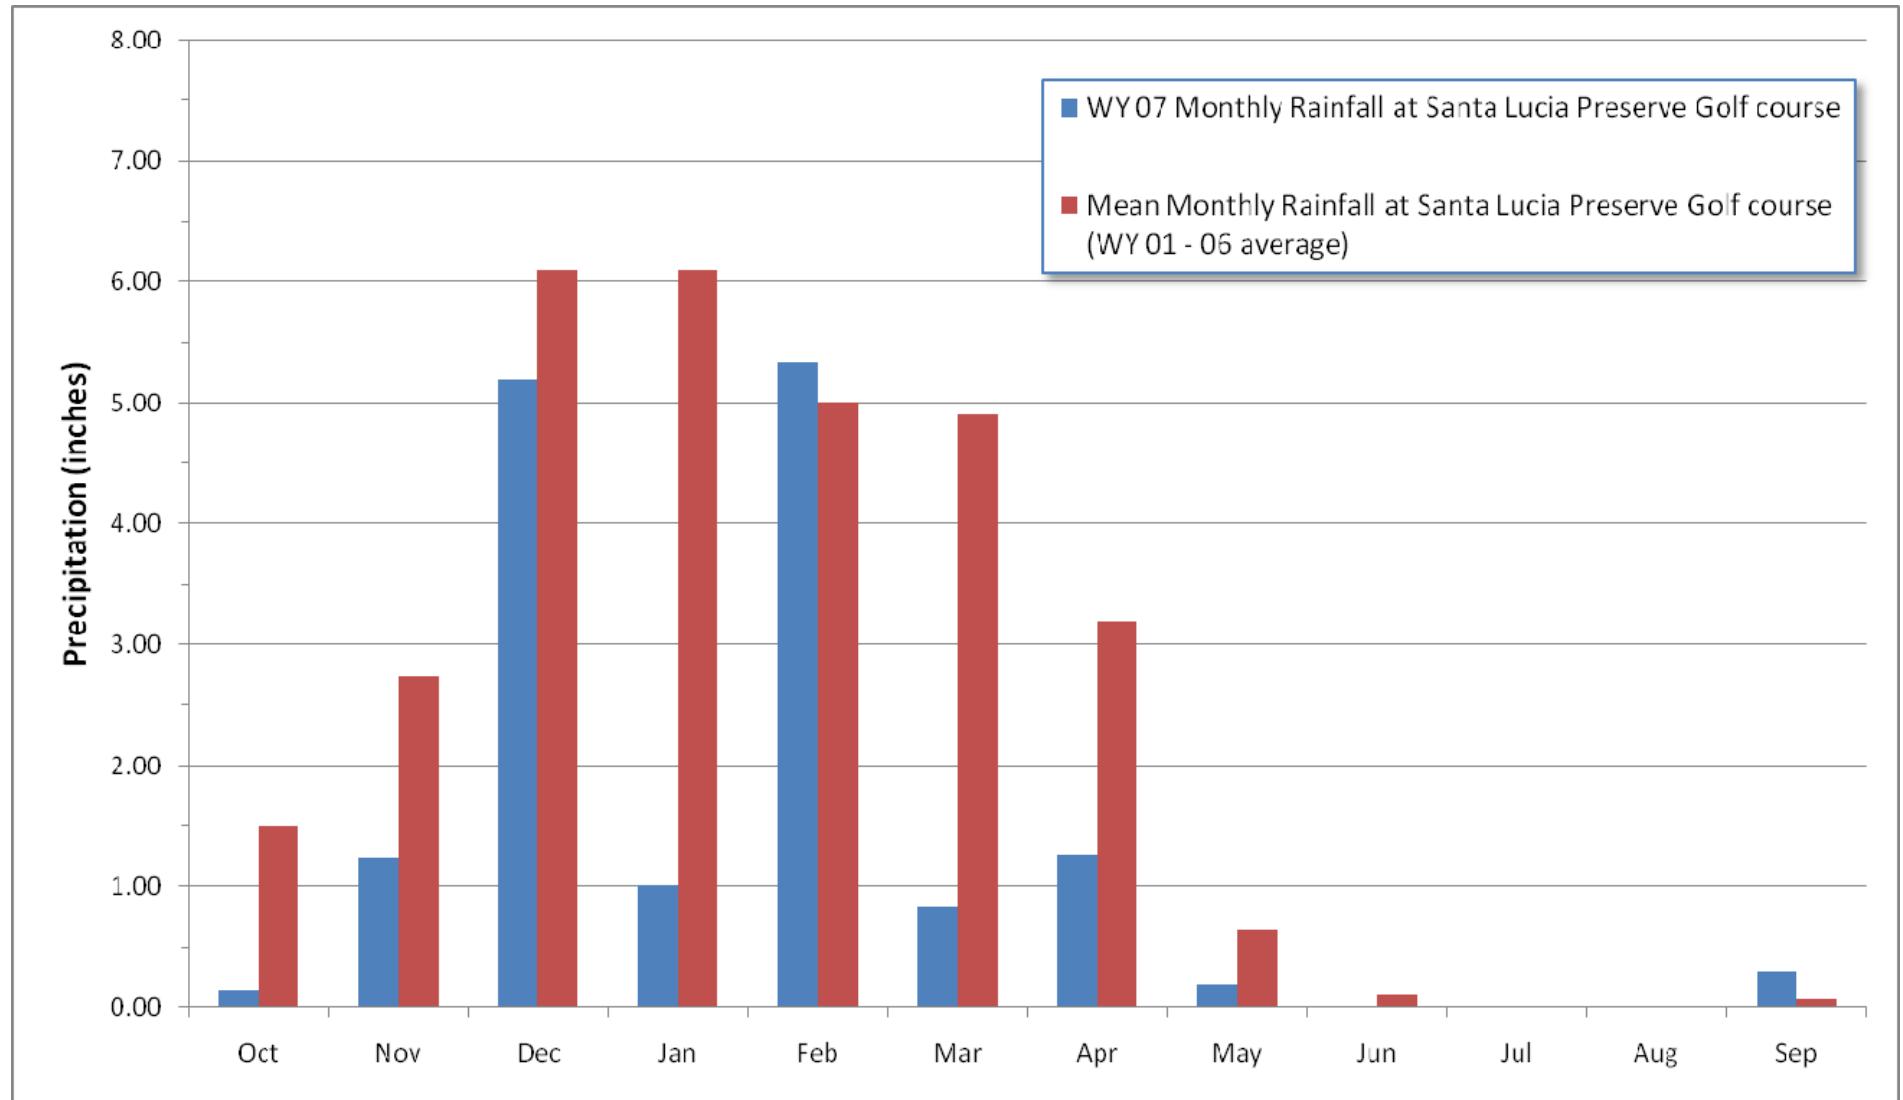

Figure 3. Monthly Precipitation at Santa Lucia Preserve Golf course for Water Year 2007. WY 2007 precipitation was below average, with January being particularly dry. Mean monthly average is based only on Water Years 2001 – 2006 and is probably not an accurate characterization of actual long-term patterns (mean monthly data from Balance Hydrologics 2006).

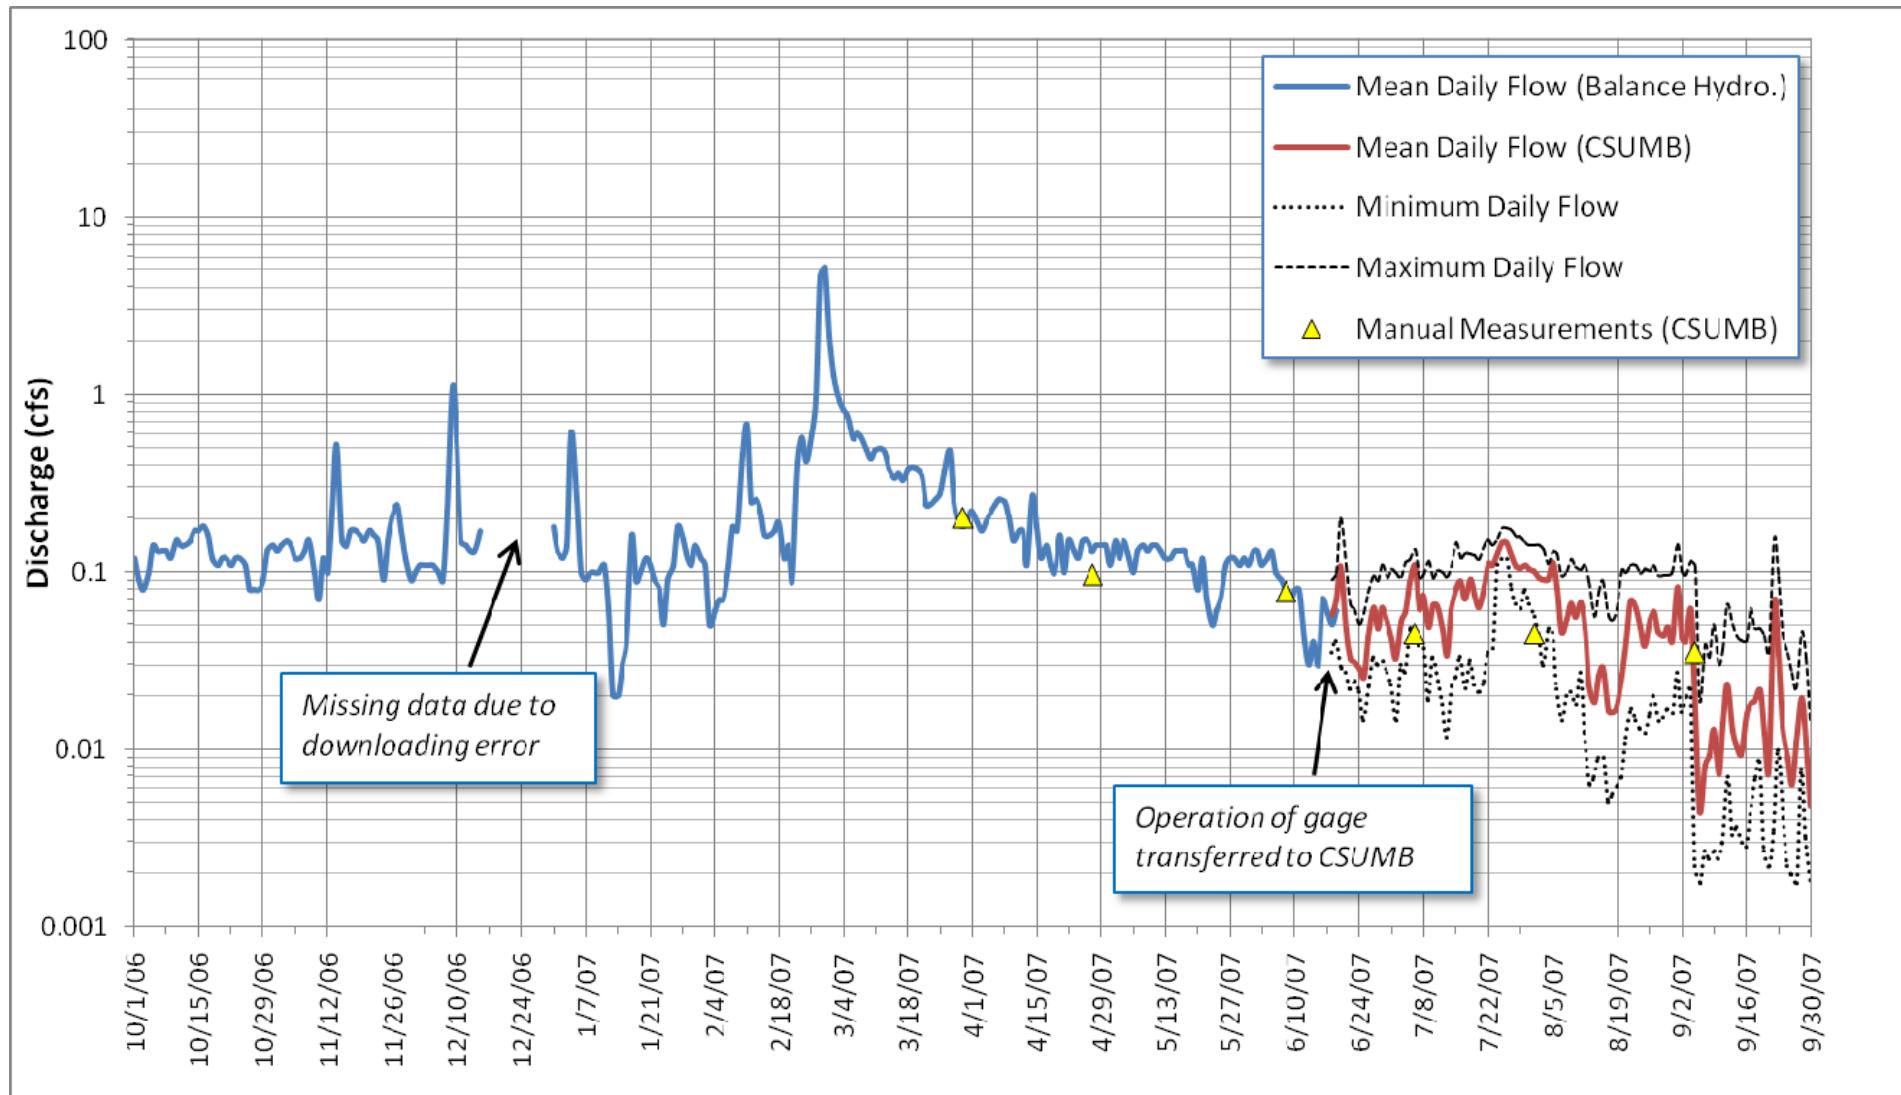

Figure 4. Mean Daily Streamflow at Potrero Creek gage for Water Year 2007. Blue line is mean daily streamflow (from Balance Hydrologics 2007b). Red line is mean daily streamflow after gage station was transferred to CSUMB; minimum and maximum daily flows are also given for this period. Yellow markers represent manual discharge measurements taken by CSUMB.

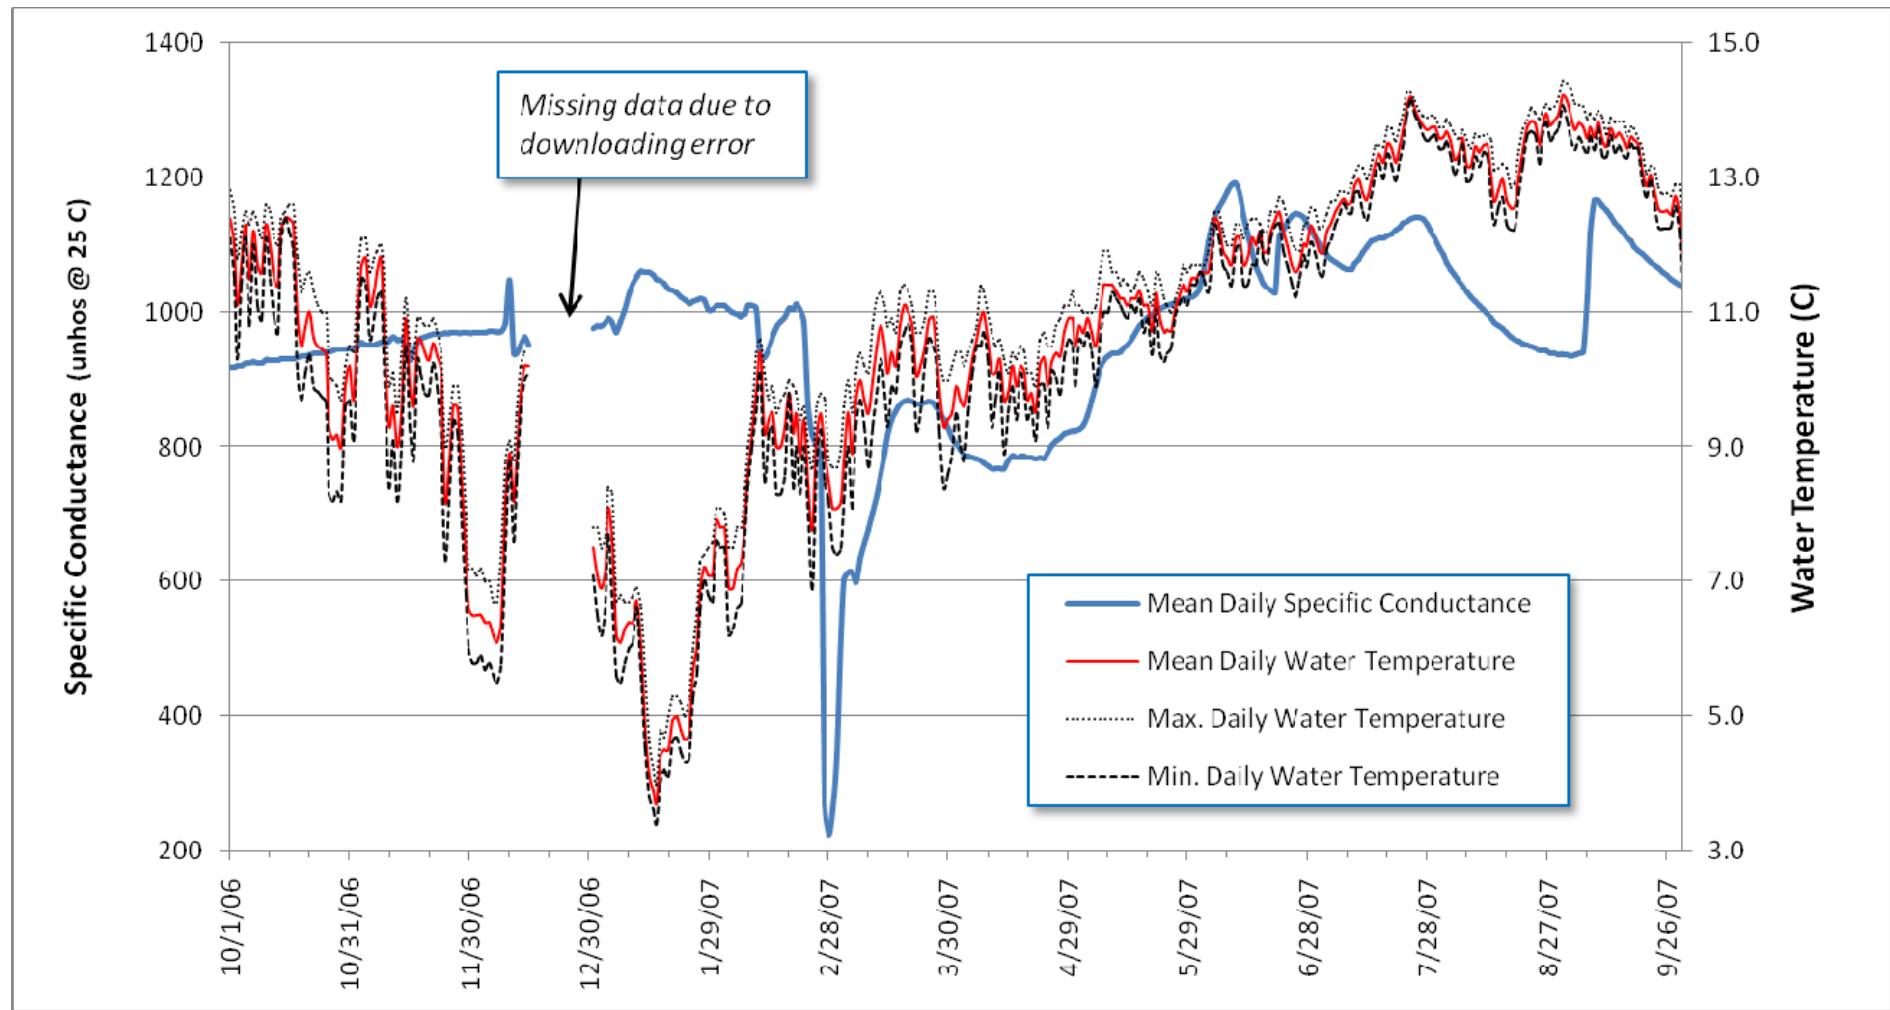

Figure 5. Daily Specific Conductance Water Temperature data at Potrero Creek gage for Water Year 2007.

Blue line is mean daily specific conductance; red line is mean daily water temperature; dotted lines represent minimum and maximum daily water temperature values.

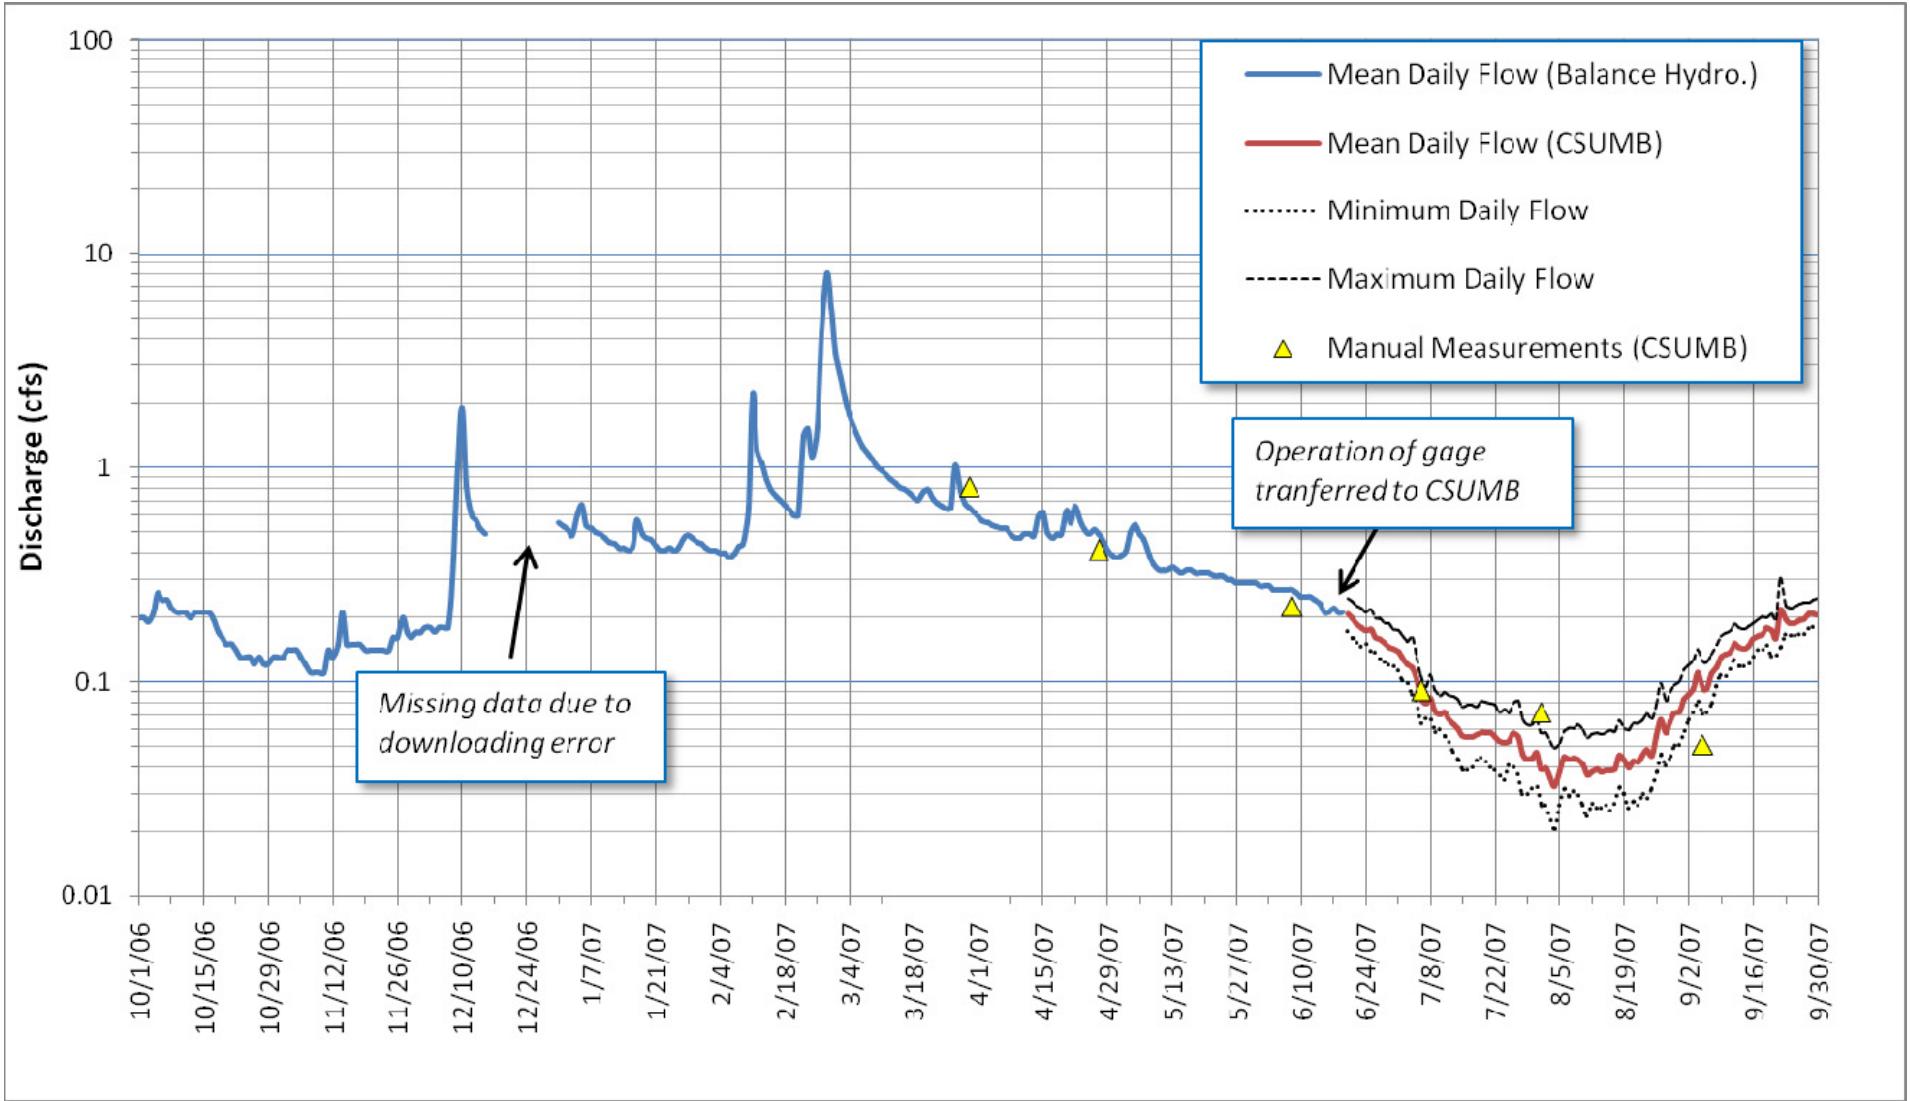

Figure 6. Mean Daily Streamflow at San Clemente Creek gage for Water Year 2007. Blue line is mean daily streamflow (from Balance Hydrologics 2007b). Red line is mean daily streamflow after gage station was transferred to CSUMB; minimum and maximum daily flows are also given for this period. Yellow markers represent manual discharge measurements taken by CSUMB.

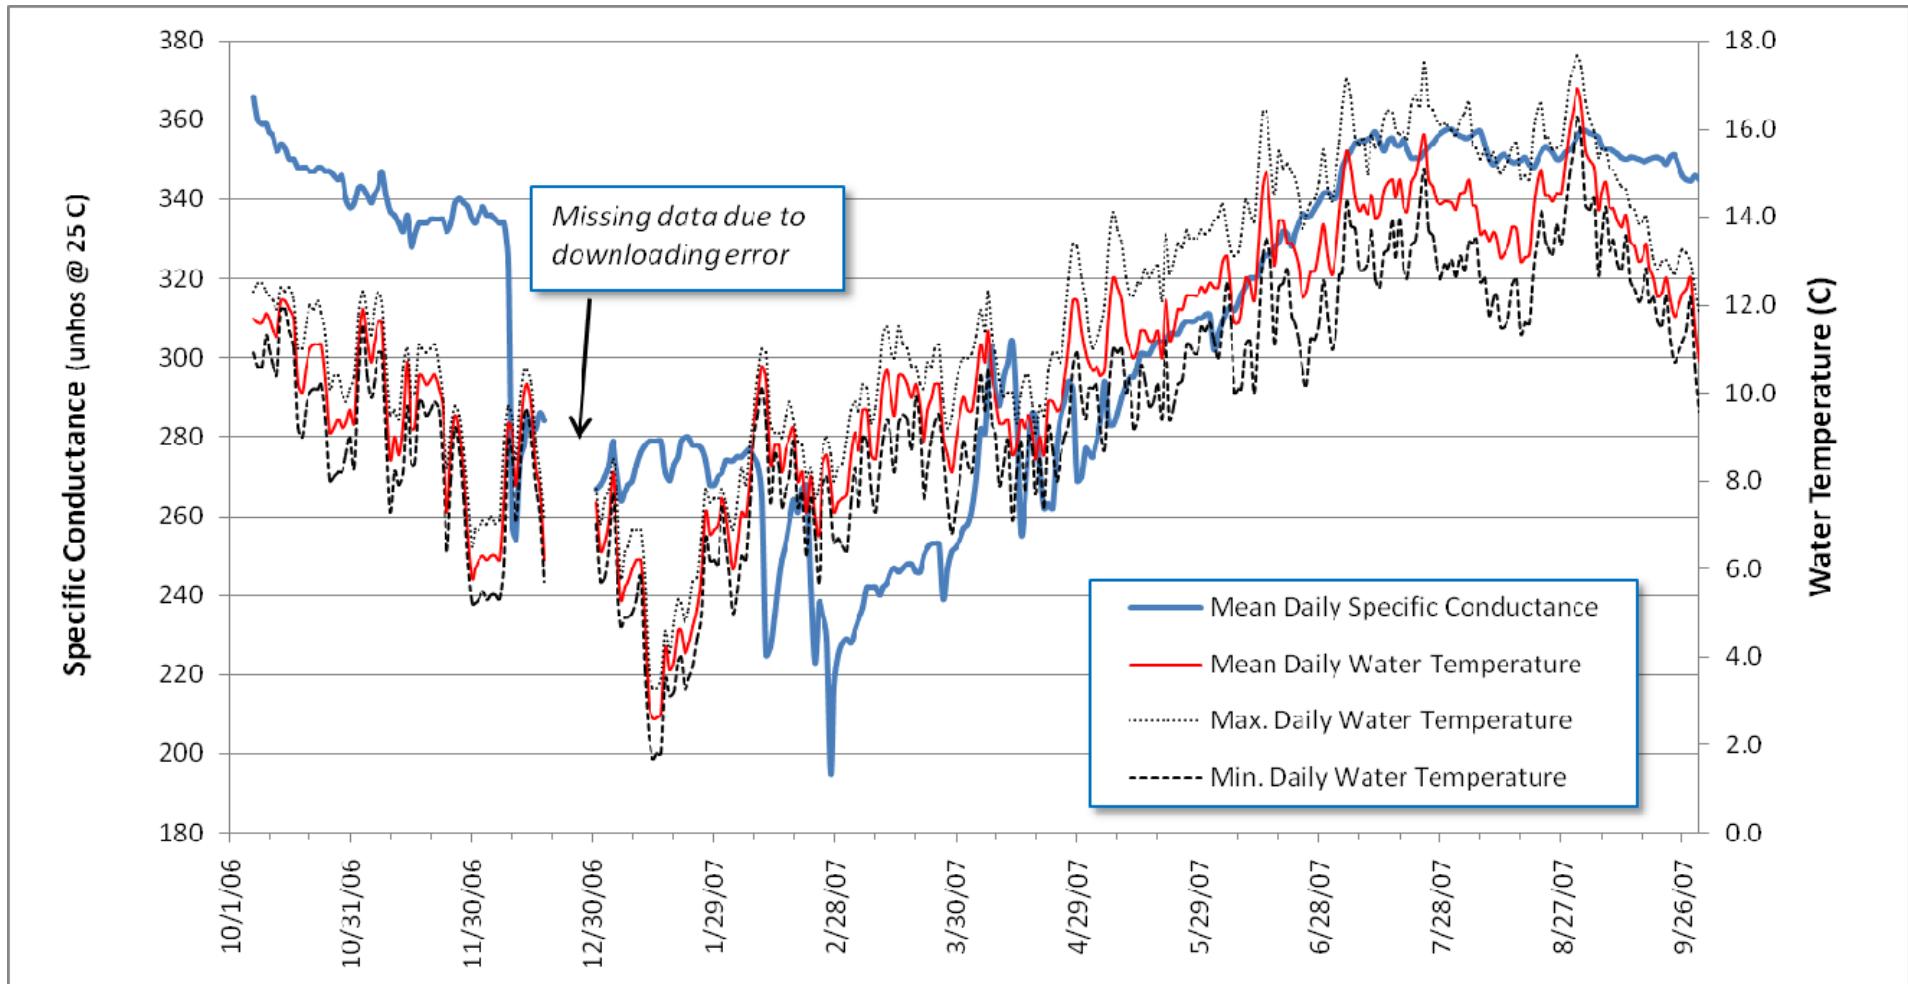

Figure 7. Daily Specific Conductance and Water Temperature data at San Clemente Creek gage for Water Year 2007. Blue line is mean daily specific conductance; red line is mean daily water temperature; dotted lines represent minimum and maximum daily water temperature values.
